

Windows 11 VM Pentest Report

Using Mythic C2 Framework with Apollo Payload

So Basically I had big issue with silver C2 and decided to try Mythic C2 Framework instead much more modern and a clean easy to use GUI. The next load of images are just me using the default options for creating a payload. Note that IP's have changed as my firewall vm was not allowing my other VM's to connect to the internet so I bypassed it for now as its not the point of this exercise.

1. Payload Creation - Target OS and Apollo Agent

2. Configure Payload Build Parameters

Mythic: v3.4.36
UI: v0.3.114

callback_host Callback Host	https://domain.com
callback_interval Callback Interval in seconds	10
callback_jitter Callback Jitter in percent	23
callback_port Callback Port	80

5. Hosting Payload on Kali (Python HTTP Server)

Its a bit old fashion throwing it up on a python server but its just about learning new tools at this point.

6. Downloading Payload on Windows Target

So as expected windows and browser firewall blocked but just for now pretending to be a unsafe user I stop all antivirus and continued to download the payload

7. Windows Security Alerts

Now this led me to believe it failed as normally I might see something and then it would close the window in a flash however...

8. Downloads Folder on Target

INTERACT	IP	HOST	USER	DOMAIN	PID	LAST CHECKIN	DESCRIPTION
1 ▾	192.168.57.129	GHACK	ghack	GHACK	10580	1 seconds	Created by mythic_admin at 2026-07-22 04:39:5

Bingo I got a hooker now to see how to use this C2

Task an agent...

10. Persistence via Scheduled Task

After some messing around and some research each command that I want to send to windows needs the shell before it. I tried some typical scheduling persistence but not much luck. It would be easier to just make a user but that would stick out like a saw thumb. But getting in with method did quite well just need a way to obscate the payload so it wont get blocked or deleted by anit virus. Which is constant theme.
